1. Analyze my attached CSE 489 Assignment 1 PDF and explain every requirement in simple language. Create a step by step roadmap covering what I need to learn and how each part contributes to the final application. Do not write any code yet.

2. Teach me the Kotlin fundamentals required for this assignment, including variables, data types, functions, conditions, loops, classes, null safety, and event handling. Explain what, why, and how each concept works, using simple examples and exercises related to my project.

3. Explain Android application architecture, Activities, the AndroidManifest.xml, Gradle, resource directories, XML layouts, and how Kotlin connects to the UI. Help me understand my Android Studio project structure before implementing anything.

4. Teach me ConstraintLayout, XML layouts, buttons, TextViews, dimension resources, and responsive UI design. Guide me through designing the numeric keypad, amount display, and change table for portrait and landscape modes, supporting the phone and tablet sizes specified in my assignment.

5. Guide me through implementing digit entry, the clear button, amount display, and taka-note calculations using Kotlin. Explain the logic before coding, give me small tasks, and review my attempts. Teach me to solve problems independently rather than generating the complete implementation.

6. Teach me how Kotlin interacts with Android UI components, how button listeners work, and how user actions update the screen. Help me connect my independently implemented UI and calculation logic one component at a time, explaining every important line.

7. Explain the Android Activity lifecycle, configuration changes, and state preservation. Guide me through preserving the entered amount and maintaining the correct change breakdown when rotating between portrait and landscape, using an approach appropriate for my assignment.
